WEEKLY CHECK-IN

HANS PUJALTE (PUJA0009)

COMP3742, TONSLEY
COMPLETED: 26/10/2026

Hans Pujalte

Question 1 Progress: What did you accomplish this past week? Any issues slowing down progress?

- Completed lab 10
- Revision into CNNs and how they are used to process digital images
- Start sketching up plan for A2, specifically the code

Question 2 Plans: What are your goals for the next week? How does this match against your overall project plan?

- Finish Artefact 2 by the weekend/early Monday
- Group meeting to go over final submission of Artefact 2

Question 3 Study: List and discuss the three main points of the material covered this week.

- CNNs utilise kernels to perform element-wise multiplication across images in early layers to detect simple patterns, e.g. edges, lines and gradients. Deeper/later layers combine these to recognise more specific patterns such faces or objects.
- Smaller filters are more preferable in CNNs since they help with lower memory consumption and parameter count. Small filters can also be stacked to increase non-linearity, making the network better at learning complex representations.
- Learnt how to develop and use if-then-else conditional statements in Prolog.

Question 4 Insights: What was the single most confusing concept ('muddiest point) for you in this week's material, and what specific question do you have about it? –

- Nothing was insanely confusing for this week's content
- Only real thing I had to review was the linear combination equation to ensure I understand how it works.

Question 5 Linkage:How could one key idea from this week's material be directly applied to your project?

- The if-then-else statements in Prolog will be used a lot in the inference layer of A2 when deciding how to classify a grid network based on numerous input variables
